PART 1. HANDS-ON QUIZ – SET A

Instructions:

Our goal is to identify the ideal customer for a bike shop. To accomplish this, we will analyze customer data from an Excel sheet containing information on Marital Status, Gender, Income, Children, Education, Occupation, Homeowner, Cars, Commute Distance, Region, Age, and Purchased Bike.

To start the project, data cleaning was performed to ensure accurate analysis. This included the removal of duplicate entries to avoid potential biases in the dataset. Furthermore, the data was updated to be more interpretable, such as replacing "m" and "f" with "male" and "female", and "m" and "s" with "married" and "single". Age groups were also created to facilitate better visualization of the data. Additionally, I ensured there was no missing data and that each field had the correct data type.

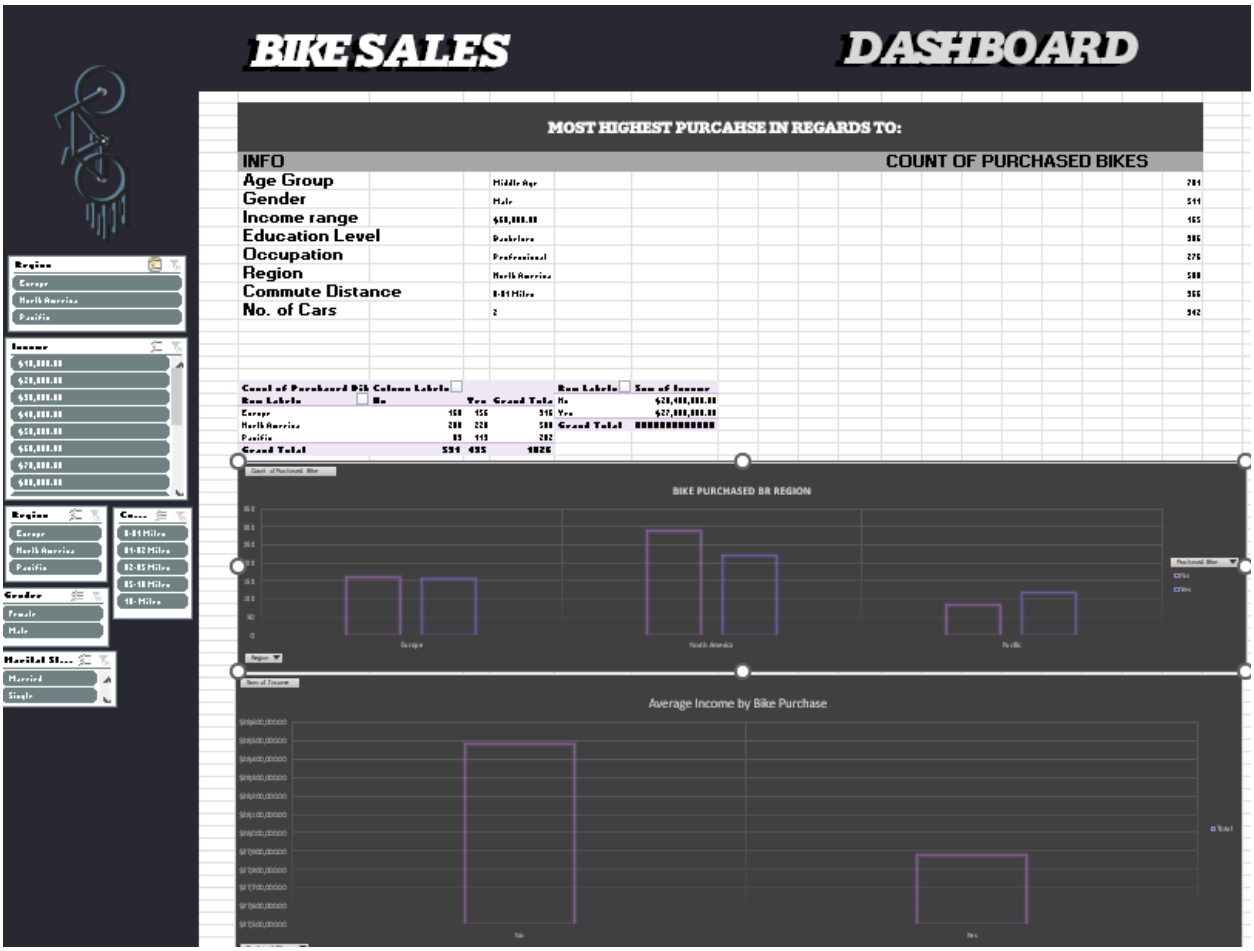
Download the Bike Sales Project Dataset
(The data is already cleaned and ready for analysis)

Analysis

You are Task to create the **PIVOT TABLES** for the following:

Business Questions:

Paste the screenshot of Dashboard



1. What is the most common age group of customers who purchase bikes from the shop?

Ans.

Most Common buyers of bike are the middle age.
